

Hello Greetings Atomity Team,
I am Rakesh & Wishing you Happy New Year,

So, Here's a brief about how i completed my task..

Requirements

- Tenant
- Team
- CostRecords
- Strict Isolation of Tenants
- Can only access tenant via tenantId in header
(At this point i was little thrown as i never worked with headers and stuff i went through google, youtube and learnt about HTTP procedures again, and saw few Examples via AI assistants that to work with HTTPServlets in Java, Where i learnt more about Filters and threadLocals and success fully implemented it)
- I also learnt about docker a little, as much required by Task!
- I drew a rough diagram about data flow of the system

Started Implementing it (there are so many things i learnt while Implementing the Task)

- Implemented Entities
- Repositories
- Tried to test the db, is it forming or not?
(At this point, postgres sql thrown an error, as i dont know how to use docker properly, i thought it might create database with tables at that point thats not the case, i created db manually at first)
- context
- Filter to filter TenantId
- Services
(in Report Service, first i implemented it with direct List without DataStructures like map, later on while working i just how about using map, i took help of few online resources and implemented it properly)
(there few time i cant debug the issues so i used AI assistants like Gpt, Gemini as debuggers)
- Dto's
- Controllers
- Tested the Tenant Isolation as well as all api endpoints manually.
(created two tenants and checked all end points and isolation)

Everything about running and testing the program is in Readme in detail! I asked AmazonQ to generate a readme for my project in detail and I also verified it.

I am Sorry for taking so much time to submit this task, i completed it in around 2 - 3 days, while i also have few academic procedures for the final year project to look after.

Overall, I really enjoyed completing this task! It made me aware of my skills and talents again and there is much more to learn and also it's shown me a clear fact of what I am capable of and adaptability. I was able to learn very quickly and adapt to the situation in no time. Which showed me how I am able to work in this industry of agile development.

Thanks for this opportunity! I dont know whether i pass or fail but I am looking forward to working with Atomity Team.
